Contract pricing, partnership models, valuation formulas with real math

AcquisitionOS — AI-Powered Client Acquisition System

Partnership Pricing & Company Valuation

Section B: Partnership and contract pricing models. Section C: Company valuation formulas with real mathematical examples using AcquisitionOS data.

Section B — Partnership & Contract Pricing

B.1 Annual Contract Pricing (with discounts)

Contract	Discount	Pro ($29/mo)	Elite ($99/mo)	Enterprise (~$500/mo)
Monthly	0%	$29/mo	$99/mo	$500/mo
3 months	5%	$82.65 total	$282.15 total	$1,425 total
6 months	10%	$156.60 total	$534.60 total	$2,700 total
12 months	15%	$295.80/year	$1,009.35/year	$5,100/year
24 months	20%	$557.60/2yr	$1,900.80/2yr	$9,600/2yr
36 months	25%	$783.00/3yr	$2,673.00/3yr	$13,500/3yr

B.2 Partnership Models

Q: Referral Partner (no minimum commitment)

A: Commission: 15% recurring (as long as the referred customer stays subscribed). Example: Refer 10 Pro customers ($29/mo each = $290/mo). You earn $43.50/month recurring. Refer 50 customers: $217.50/month recurring. No contract, no minimum. You get a unique referral link. Payout: monthly via Stripe Connect.

Q: Reseller Partner ($1,000/month minimum)

A: Commission: 25% recurring. Wholesale rate: 50% off published prices (you buy Pro at $14.50, sell at $29+). You can set your own price. Example: Buy 50 Pro seats at $14.50 = $725/month wholesale. Sell at $39/month = $1,950 revenue. Profit: $1,225/month. Co-branded landing page. Monthly reporting. 6-month minimum commitment.

Q: White-Label Partner ($5,000/month minimum)

A: Commission: 35% recurring + wholesale at 65% off. Your branding, your domain (acquisition.youragency.com), your pricing. We power the backend. Example: Buy 100 Elite seats at $34.65 = $3,465/month. Sell at $149/month = $14,900 revenue. Profit: $11,435/month. Dedicated support. 12-month minimum commitment. Non-compete clause.

Q: Strategic Partner (equity or revenue share)

A: For companies bringing significant distribution (1000+ customers) or technology (exclusive data source, AI model). Structures: (1) Revenue share: 30-50% of revenue from jointly acquired customers. (2) Equity: 1-5% of AcquisitionOS equity for exclusive partnership. (3) Joint venture: 50/50 revenue on a white-label product. Negotiated case-by-case. Requires founder-level discussion.

B.3 Contract Pricing Calculator (Examples)

Q: Example 1: Agency wants 10 Pro seats, 12-month contract

A: Base: 10 × $29 = $290/month. Annual: $3,480. With 15% annual discount: $3,480 × 0.85 = $2,958/year. Effective monthly: $246.50 (instead of $290). Savings: $522/year. Credits: 10 × 750 = 7,500 credits/year.

Q: Example 2: Company wants 25 Elite seats, 24-month contract

A: Base: 25 × $99 = $2,475/month. 24-month: $59,400. With 20% discount: $59,400 × 0.80 = $47,520/2years. Effective monthly: $1,980 (instead of $2,475). Savings: $11,880 over 2 years. Credits: 25 × 2,000 = 50,000 credits/month = 1,200,000 credits over 2 years.

Q: Example 3: Enterprise wants custom, 36-month contract, 100 users

A: Base rate: $500/user/month × 100 = $50,000/month. 36-month: $1,800,000. With 25% discount: $1,350,000/3years. Effective monthly: $37,500. Savings: $450,000. Includes: dedicated infrastructure, custom integrations, SLA (99.9% uptime), dedicated account manager, custom branding, unlimited credits, priority support.

Section C — Company Valuation Formulas

Multiple valuation methodologies with real mathematical examples. AcquisitionOS is pre-revenue, so revenue-based methods show $0 — but they're included for completeness once revenue begins.

C.1 Revenue Multiple Method

Valuation = Annual Recurring Revenue (ARR) × Industry Multiple. SaaS companies typically trade at 5-15x ARR depending on growth rate, gross margin, and retention.

Scenario	ARR	Multiple	Valuation	Notes
Pre-revenue (today)	$0	N/A	$0	Can't use this method yet
$10K MRR (early)	$120K	8x	$960K	Early-stage, moderate growth
$50K MRR (growth)	$600K	10x	$6M	Strong growth, good retention
$100K MRR (scaling)	$1.2M	12x	$14.4M	High growth, premium multiple
$500K MRR (mature)	$6M	8x	$48M	Slower growth, lower multiple

C.2 DCF (Discounted Cash Flow) Method

Valuation = Sum of future cash flows discounted to present value + terminal value. Formula: DCF = Σ (CF_t / (1+r)^t) + (CF_n × (1+g)) / ((r-g) × (1+r)^n) where CF = cash flow, r = discount rate, g = growth rate, n = years.

Q: DCF Example (projected, 5-year horizon)

A: Assumptions: Year 1: -$50K (building), Year 2: $20K, Year 3: $100K, Year 4: $300K, Year 5: $600K. Discount rate: 25% (high risk, early stage). Terminal growth: 5%. Calculation: Y1: -$50K / 1.25 = -$40K. Y2: $20K / 1.5625 = $12.8K. Y3: $100K / 1.9531 = $51.2K. Y4: $300K / 2.4414 = $122.9K. Y5: $600K / 3.0518 = $196.6K. Terminal: ($600K × 1.05) / (0.25 - 0.05) / 3.0518 = $630K / 0.20 / 3.0518 = $1,032K. DCF = -40 + 12.8 + 51.2 + 122.9 + 196.6 + 1,032 = $1,375.5K ≈ $1.38M.

C.3 Berkus Method (pre-revenue)

For pre-revenue startups. Assigns value to 5 risk-reduction milestones, each worth up to $500K (adjusted for market).

Milestone	Max Value	AcquisitionOS Status	Value Assigned
Sound Idea (prototype)	$500K	■ Working product	$500K
Prototype (working)	$500K	■ Functional MVP	$500K
Quality Management Team	$500K	■■ Solo founder	$100K
Strategic Relationships	$500K	■■ No partnerships yet	$0
Product Rollout / Sales	$500K	■ No revenue yet	$0
TOTAL	$2.5M		$1,100K = $1.1M

C.4 Scorecard Valuation Method

Compares the startup to recently funded similar companies, adjusting for strengths/weaktheses across 7 factors.

Factor	Weight	AcquisitionOS Assessment	Adjustment
Strength of Management	30%	Solo founder, technical	-30% (no team)
Size of Opportunity	25%	$16.7B market by 2032	+20% (large)
Product/Technology	15%	Working MVP, real data	+10% (proven)
Competitive Environment	10%	11x.ai, Apollo, HubSpot	-15% (crowded)
Marketing/Sales	10%	No GTM yet	-20% (unproven)
Need for Additional Capital	5%	Low burn, small raise	+5% (efficient)
Other (IP, partnerships)	5%	No patents, India focus	-5%
Weighted Average	100%		-10% adjustment

Base valuation (avg pre-revenue SaaS in India): $2M. Adjusted: $2M × (1 + (-0.10)) = $1.8M.

C.5 Risk Factor Summation Method

Start with base valuation ($2M for pre-revenue tech startup in India), then add/subtract $250K for each of 12 risk factors.

Risk Factor	Assessment	Adjustment
Management Risk	Solo founder	-$250K
Stage of Business	MVP, pre-revenue	-$250K
Legislation/Political Risk	Low (India IT-friendly)	+$0
Manufacturing Risk	N/A (software)	+$0
Sales/Marketing Risk	No GTM execution yet	-$250K
Capital Funding Risk	Small raise, manageable	+$0
Competition Risk	Well-funded competitors	-$250K
Technology Risk	Proven stack, working product	+$250K
Litigation Risk	None	+$0
International Risk	India-first, lower exposure	+$0
Reputation Risk	No brand yet	-$0
Potential Lucrative Exit	Acquisition by HubSpot/Salesforce pos	+$250K
NET Adjustment		-$500K

Base: $2M. Net adjustment: -$500K. Final valuation: $1.5M.

C.6 Valuation Summary (Recommended Range)

Method	Valuation	Best For
Berkus	$1.1M	Pre-revenue, technology proven
Scorecard	$1.8M	Pre-revenue, compared to peers
Risk Factor	$1.5M	Pre-revenue, risk-adjusted
DCF (projected)	$1.38M	Future cash flow projection
Revenue Multiple	$0 (today)	Post-revenue only
RECOMMENDED RANGE	$1.2M - $2.0M	Pre-seed / angel round

C.7 Investment Offer Structures

Q: Equity-based investment (recommended for $250K-500K raise)

A: Pre-money valuation: $1.5M. Investment: $250K. Post-money: $1.75M. Investor equity: $250K / $1.75M = 14.3%. Investment: $500K. Post-money: $2M. Investor equity: $500K / $2M = 25%. Founder retains 75-86%. Vesting: founder equity vests over 4 years (1-year cliff). Board: 1 founder + 1 investor = 2 seats.

Q: Revenue-based investment (alternative, no equity dilution)

A: Investor provides $250K. Repayment: 5% of monthly revenue until $350K repaid (1.4x multiple). At $20K MRR: $1,000/month repayment → 350 months (too slow). At $50K MRR: $2,500/month → 140 months. At $100K MRR: $5,000/month → 70 months. Best for when revenue is $50K+/month. Cap: if revenue exceeds $200K/month, repayment accelerates to 8%.

Q: SAFE (Simple Agreement for Future Equity)

A: Investor gives $250K via SAFE with a $2M valuation cap and 20% discount. At next funding round (Series A at $5M pre-money): investor gets equity at min($2M cap, $5M × 0.80 = $4M) = $2M valuation. So $250K / $2M = 12.5% equity at Series A. No equity granted now — only at the next round. Pro: simple, no valuation negotiation now. Con: uncertainty for investor.

Q: Convertible Note

A: $250K loan at 5% interest, 2-year maturity, $2M valuation cap, 20% discount. At maturity: either repays $250K + interest ($275K), or converts to equity at the cap/discount. At Series A ($5M pre): converts at $2M cap. $275K / $2M = 13.75% equity. Pro: investor has downside protection (loan). Con: debt on the balance sheet.

Q: Full acquisition (if someone wants to buy AcquisitionOS)

A: Valuation basis: Pre-revenue, so use Berkus + Scorecard methods. Recommended asking price: $1.5M-3M (depending on acquirer's strategic value). Structures: (1) Cash + equity: $500K cash + 2% equity in acquirer. (2) All-cash: $1.5M (founder walks away). (3) Earn-out: $800K upfront + $700K over 2 years tied to revenue targets. (4) Talent acquisition: $300K + employment contract ($150K/year for 2 years). Realistic: $500K-1M for the codebase + founder as employee.
